## 1. Introduction

### 1.1 Terms of Reference

Maydencroft Limited was commissioned by Alex Cole of CSA Environmental to undertake a Tree Survey of all trees on an area of Chorleywood Common known as 15A, located close to Chorleywood Bottom Road and adjacent to the car park of Chorleywood Train Station.

The survey has been produced in accordance with British Standard 5837:2012 Trees in relation to design, demolition and construction - Recommendations, and is based upon a plan showing an indicative site boundary supplied by Alex Cole. The site is owned and managed by Chorleywood parish Council, and it is understood that the council intend to construct within the site a naturalistic play area.

The aim of this survey is to provide information on the location, quality and condition of trees on 15 A in order to inform the design and construction of the play area, and to minimise or where possible avoid impact on the Root Protection Areas (RPAs) of retained trees. The survey also gives pragmatic advice about the removal of trees or particular surgery works where deemed essential.

It should be noted that this report does not constitute an Arboricultural Impact Assessment, Arboricultural Method Statement or Tree Protection Plan.

### 1.2 Scope of Works

A survey of 15 A was carried out on Friday $28^{\text {th }}$ July 2017 by Mark McCallum, Consultant Arboriculturalist \& Woodland Specialist at Maydencroft Limited. Mark has a degree in BSc (hons) Rural Environment Studies and holds the Lantra Professional Tree Inspection qualification. He has over 15 years of experience as an arboricultural consultant and works for a broad range of clients carrying out tree surveys, tree safety inspections, woodland management plans, and forestry.

Writing of the report and production of mapping was led by Jon Collins BSc (Hons) CMLI, Senior Landscape Consultant at Maydencroft Limited. Jon has a degree in BSc (hons) Landscape Management, is a Chartered Member of the Landscape Institute, and holds the Lantra Professional Tree Inspection qualification. He manages large tree safety inspections on behalf of utility companies and local authorities, and specialises in BS5837:2012 related tree planning work, including Tree Surveys.

The weather on the day of the survey was warm with occasional showers and blustery winds. All of the trees on 15A were inspected using the Visual Tree Assessment (VTA) methodology, detailed in "The Body Language of Trees" (Mattheck \& Breloer, HMSO, 1994). The absence of a Topographic Site Survey meant that grid references were recorded for each of the trees to enable their locations to be plotted.

## Maydencroft

Details of all trees are listed in the schedule below with quantitative and qualitative information included as required by BS 5837:2012 sections 4.4 to 4.6 . The information has been used to create a Tree Survey Plan (Appendix A) showing the location of the trees, their crown spread, and their Root Protection Areas (RPAs). Appendix B includes a version of this plan with the RPAs removed for clarity.

### 1.3 Site Description

The small site of 15 A lies on the south eastern corner of Chorleywood Common, a County Heritage Site and Local Nature Reserve consisting of approximately 80 hectares of grassland and broadleaf secondary woodland.

The trees and woodland on site have flourished since the early 20th Century, when cattle grazing by the commoners' stopped, allowing scrub to develop and birch, oak, cherry and ash to mature. The site has open public access and is well used by dog walkers, horse riders, hikers and golfers.

15A comprises a small compartment of secondary woodland, scrub and grassland approximately 0.7 ha in size. It is located to the north east of the access road that links the train station car park with Chorleywood Bottom road, and to the south west of the railway line.

## 2. Tree Survey

This chapter is supported by the Tree Survey plans included in Appendix A and B of this report.

### 2.1 On site trees

15A contains a variety of semi-mature broadleaf species comprising ash ( $60 \%$ ), oak ( $15 \%$ ), field maple ( $10 \%$ ), cherry ( $10 \%$ ), hazel ( $4 \%$ ) and hornbeam ( $1 \%$ ).

### 2.2 Off site trees

It is not thought that any off site trees stand to be affected by the development proposal.

### 2.3 Tree categories

All trees on 15A have been assessed and categorised in accordance with the guidelines in BS5837:2012. The following table includes a brief summary of the categories with more details provided in Table 1 of the British Standard.

| Trees to be considered for retention |  |
| :--- | :--- |
| Category A | Trees of high quality with an estimated remaining life <br> expectancy of at least 40 years. |
| Category B | Trees of moderate quality with an estimated remaining life <br> expectancy of at least 20 years. |
| Category C | Trees of low quality with an estimated remaining life <br> expectancy of at least 10 years, or young trees with a stem <br> diameter below 150mm. |
| Trees unsuitable for retention |  |
| Category U | Those in such a condition that they cannot realistically be <br> retained as living trees in the context of the current land use <br> for longer than 10 years. |

### 2.4 Root Protection Areas (RPAs)

The RPAs for the trees recorded by the tree survey have been calculated in accordance with the guidance in chapter 4.6 of BS5837:2012. For single stem trees, the RPA is equivalent to a circle with radius 12 times the stem diameter.

For trees with between two to five stems, the combined stem diameter is calculated by finding the square root of the sum of the squared stem diameters. For trees with more than five stems, the combined stem diameter is calculated by finding the square root of the sum of the mean stem diameter squared multiplied by the number of stems.

## 3. Recommendations

### 3.1 Chalara dieback of ash (Hymenoscyphus fraxineus)

Approximately $95 \%$ of the ash trees on 15A are displaying signs consistent with the early on-set of Chalara. General crown condition is weaker than would normally be expected at the time of year, with a reduced number of leaves present and numerous dead minor to medium sized branches throughout the crowns. Some trees are at a more advanced stage with medium to major limbs infected and dead (i.e. T16 - a mature ash coppice stool).
$60 \%$ of the trees on site are ash. Due to the nature of the proposed development, its high public use and its proximity to a public highway, a long-term plan for the species should be developed. This could comprise two options:

Option 1: Select and fell the worse effected ash trees that are within the closest proximity to the development and the road. Regularly monitor the remaining trees (preferably annually) and fell as required.

Option 2: Fell all ash on site and replace with a suitable, low growing, native broadleaf species such as hazel, or a mix of natives. Although a drastic approach, this option will ensure long term public safety and will not require expensive ongoing monitoring.

Either of the above options will require a Forestry Commission Felling License which should be acquired before any work commences.

### 3.2 Ivy

As is common in secondary woodland, many of the trees on 15 A are ivy clad. This is problematic as it impedes the accurate visual assessment of stems and crowns. It can also prove to be a problem for the safety of the trees themselves by creating a "sail-effect" in high winds, meaning that the trees are potentially more unstable and more prone to wind blow. Any trees to be retained should have ivy carefully severed at the base. This work should be carried out on a regular basis, usually every 3 years on a site such as this.

### 3.3 Cherry

This species on site is displaying obvious signs of distress with all stems in decline. All trees within group 8 on the north east corner of 15A (approximately 40 stems of varying diameters) have very poor leaf growth and their stems are in poor condition. It is recommended that these trees are felled due to their location being within falling distance of the railway security fence and the proposed development. Tree 14 is displaying similar problems and should also be felled.

### 3.4 Trees for retention

Other species on 15A are doing very well and should be retained for their ecological and aesthetic qualities. Semi-mature oak, field maple, hazel and hornbeam trees should all be retained where possible. All will require ivy to be severed at their bases, if necessary, and
some would benefit from having understorey species such as holly and blackthorn cleared from around their root zones in order to fully display their aesthetic qualities.

It is recommended that oak trees T65 and T69 are felled in order to free-up the adjacent oaks T66, T67 and T68. This will allow the retained stems to flourish.

T16 is a lovely example of a mature ash coppice stool. Although it shows relatively advanced effects of Chalara, it could be retained and even incorporated in to the proposed development, particularly if it was heavily reduced. The tree would require on-going annual monitoring, but its size and age (at least 150 years old) should warrant retention.

### 3.5 Improving views

Certain trees or groups of trees could be felled to improve the view of 15A from the road to the south and the nearby village. At present, the large volume of trees is preventing this. In particular, trees along the southern boundary (no. T43 to T59), group 63 on the south east corner, and those on the eastern boundary. These trees could either be thinned (selectively felled) or removed entirely if improving views is desirable as part of this project.

## Appendix C

## TREE SCHEDULE TERMS

TREE NO.

SPECIE

HEIGHT The height of the tree in metres.
AGE

STEMS

GRID REF

GENERAL OBSERVATIONS

DBH The Diameter at Breast Height of the tree in millimetres; this figure is used to calculate the RPA.

RPA RADIUS The radius of the tree's Root Protection Area in metres.

CROWN SPREAD The extent of the tree's crown to the north, south, east and west, in metres.

BS CAT The BS 5837:2012 Category for the tree, in accordance with the table in paragraph 2.3 of this report.
Code used to identify each tree on the Tree Survey Plan
The common name for each tree.

The age of the tree recorded as follows:
Y Young Recently planted or establishing tree;
SM Semi-mature Established tree which has yet to reach its full growing height;
M Mature A tree which has reached its likely maximum size;
OM Over-mature A mature tree which has ceased to grow or is in decline;
V Veteran An over-mature tree of high value due to age, size and other factors.

Number of stems present (i.e. is the tree a multi-stemmed specimen).

The full grid reference recorded for each tree on site using a Personal Digital Assistant (PDA).

Any significant defects or other observations recorded as part of the survey.
